NTE4016B & NTE4016BT Integrated Circuit CMOS, Quad Analog Switch/Quad Multiplexer

Description:

The NTE4016B (14-Lead DIP) and NTE4016BT (SOIC-14) quad bilateral switches are constructed with MOS P-channel and N-channel enhancement mode devices in a single monolithic structure. Each device consists of four independent switches capable of controlling either digital or analog signals. The quad bilateral switch is used in signal gating, chopper, modulator demodulator and CMOS logic implementation.

Features:

- Diode Protection on All Inputs
- Supply Voltage Range = 3.0 Vdc to 18Vdc
- Linearized Transfer Characteristics
- Low Noise – $12\text{nV}/\sqrt{\text{Cycle}}$, $f \geq 1.0\text{kHz}$ typical
- This Device Has Inputs and Outputs Which Do Not Have ESD Protection. Antistatic Precautions Must Be Taken.

Note 2. All unused inputs must be returned to V_{DD} or V_{SS} .

Note 3. Data labeled "Typ" is not to be used for design purposes but is intended as an indication of the device's potential performance.

Note 4. For voltage drops across the switch (ΔV_{switch}) > 600mV (> 300mV at high temperature), excessive V_{DD} current may be drawn; i.e., the current out of the switch may contain both V_{DD} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded (See first page of this data sheet.).
