

DS125BR800 Low-Power 12.5-Gbps 8-Channel Repeater With Input Equalization and Output De-Emphasis

1 Features

- Comprehensive Family, Proven System Inter-Operability
 - DS125BR111: One-Lane Repeater
 - DS125BR401: Four-Lane Repeater
 - DS125BR800: Eight-Channel Repeater
 - DS125MB203: Two-Port 2:1/1:2 Mux/Switch
 - DS125DF410: Four-Channel Retimer With CDR
- Low 65-mW/Channel (Typical) Power Consumption, With Option to Power Down Unused Channels
- "Non-Limiting" Output for PCIe and 10G-KR Link Training Support
- Advanced Signal Conditioning Features
 - Receive Equalization up to 30 dB at 6.25 GHz
 - Transmit De-Emphasis up to –12 dB
 - Transmit Output Voltage Control: 700 mV to 1300 mV
- Programmable Through Pin Selection, EEPROM, or SMBus Interface
- Single Supply Voltage: 2.5 V or 3.3 V (Selectable)
- 40°C to 85°C Operating Temperature Range
- 3-kV HBM ESD Rating
- Flow-Thru Pinout: 54-Pin WQFN (10-mm × 5.5-mm, 0.5-mm Pitch)
- Supported Protocols
 - sRIO, Infiniband, Interlaken, CPRI, OBSAI
 - Other Proprietary Interface up to 12.5 Gbps

2 Applications

- SAS/SATA (up to 6 Gbps), Fibre Channel (up to 10GFC)
- PCIe Gen-3/2/1, 10G-KR, 10GbE, XAUI, RXAUI

3 Description

The DS125BR800 device is an extremely low-power high-performance multiprotocol repeater/redriver designed to support eight channels of PCIe Gen-3/2/1, 10G-KR, and other high-speed interface serial protocols up to 12.5 Gbps. The continuous time linear equalizer (CTLE) of the receiver provides a boost of up to +30 dB at 6.25 GHz (12.5 Gbps) in each of its eight channels and can open an input eye that is completely closed due to intersymbol interference (ISI) induced by interconnect medium such as 30in+ backplane traces or 8m+ copper cables, hence enabling host controllers to ensure an error-free end-to-end link. The transmitter provides a de-emphasis boost of up to –12 dB and output voltage amplitude control from 700 mV to 1300 mV to allow maximum flexibility in the physical placement within the interconnect channel.

5 Description (cont.)

When operating in 10G-KR and PCIe Gen-3 mode, the DS125BR800 transparently allows the host controller and the end point to optimize the full link and negotiate transmit equalizer coefficients. This seamless management of the link training protocol ensures system-level interoperability with minimum latency. With a low power consumption of 65 mW per channel (typical) and option to turn off unused channels, the DS125BR800 enables energy efficient system design. A single supply of 3.3 V or 2.5 V is required to power the device.

The programmable settings can be applied easily through pins, software (SMBus or I2C) or loaded through an external EEPROM. When operating in the EEPROM mode, the configuration information is automatically loaded on power up, which eliminates the need for an external microprocessor or software driver.

CONTROL PINS — SHARED (LVCMOS)			
ENSMB	48	I, 4-LEVEL, LVCMOS	System Management Bus (SMBus) Enable pin Tie 1 kΩ to VDD = Register Access SMBus Slave Mode FLOAT = Read External EEPROM (Master SMBUS Mode) Tie 1 kΩ to GND = Pin Mode
ENSMB = 1 (SMBUS MODE)			
AD0-AD3	54, 53, 47, 46	I, 4-LEVEL, LVCMOS	ENSMB Master or Slave mode SMBus Slave Address Inputs. In SMBus mode, these pins are the user set SMBus slave address inputs. There are 16 addresses supported by these pins. Pins must be tied LOW or HIGH when used to define the device SMBus address.
READ_EN	26	I, 2-LEVEL, LVCMOS	When using an External EEPROM, a transition from high to low starts the load from the external EEPROM
SCL	50	I, 2-LEVEL, LVCMOS, O, OPEN Drain	Clock output when loading EEPROM configuration, reverting to SMBus clock input when EEPROM load is complete (ALL_DONE = 0). External 2-kΩ to 5-kΩ pullup resistor to VDD (2.5-V Mode) or VIN (3.3-V Mode) recommended as per SMBus interface standards.
SDA	49	I, 2-LEVEL, LVCMOS, O, OPEN Drain	In both SMBus Modes, this pin is the SMBus data I/O. Data input or open-drain output. External 2-kΩ to 5-kΩ pullup resistor to VDD (2.5-V Mode) or VIN (3.3-V Mode) recommended as per SMBus interface standards.
ENSMB = 0 (PIN MODE)			
DEMA0, DEMA1, DEMB0, DEMB1	49, 50, 53, 54	I, 4-LEVEL, LVCMOS	DEMA[1:0] and DEMB[1:0] control the level of de-emphasis of the output driver. The pins are only active when ENSMB is de-asserted (low). The 8 channels are organized into two banks. Bank A is controlled with the DEMA[1:0] pins and bank B is controlled with the DEMB[1:0] pins. When ENSMB goes high the SMBus registers provide independent control of each channel. The DEMA[1:0] pins are converted to SMBUS SCL/SDA and DEMB[1:0] pins are converted to AD0, AD1 inputs. See Table 3 .
EQA0, EQA1, EQB0, EQB1	20, 19, 46, 47	I, 4-LEVEL, LVCMOS	EQA[1:0] and EQB[1:0] control the level of equalization on the input pins. The pins are active only when ENSMB is deasserted (low). The 8 channels are organized into two banks. Bank A is controlled with the EQA[1:0] pins and bank B is controlled with the EQB[1:0] pins. When ENSMB goes high the SMBus registers provide independent control of each channel. The EQB[1:0] pins are converted to SMBUS AD2/AD3 inputs. See Table 2 .

- (1) LVCMOS inputs without the FLOAT conditions must be driven to a logic low or high at all times or operation is not ensured.
Input edge rate for LVCMOS/FLOAT inputs must be faster than 50 ns from 10–90%.
For 3.3-V Mode operation, VIN pin = 3.3 V and the VDD for the 4-level input is 3.3 V.
For 2.5-V Mode operation, VDD pin = 2.5 V and the VDD for the 4-level input is 2.5 V.

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the [Recommended Operating Conditions](#) is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. Absolute Maximum Numbers are specified for a junction temperature range of -40°C to +125°C. Models are validated to Maximum Operating Voltages only.
- (2) For soldering specifications: see product folder at [Absolute Maximum Ratings for Soldering](#) (SNOA549).

- (1) Typical values represent most likely parametric norms at VDD = 2.5 V, TA = 25°C., and at the [Recommended Operating Conditions](#) at the time of product characterization and are not guaranteed.
- (2) The Electrical Characteristics tables list specified specifications under the listed [Recommended Operating Conditions](#) except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are **not** guaranteed.
- (3) Specified by device characterization.
- (4) In PCIe Gen-3 mode, the output VOD level is not fixed. It will be adjusted automatically based on the VID input amplitude level. The output VOD level set by DEMA/B[1:0] in this MODE is dependent on the VID level and the frequency content. The DS125BR800 repeater is designed to be non-limiting in this MODE, so the TX-FIR (de-emphasis) is passed to the RX to support the handshake negotiation link training.

8 Detailed Description

8.1 Overview

The DS125BR800 compensates for lossy printed-circuit board backplanes and balanced cables.

The DS125BR800 operates in 3 modes: Pin Control Mode (ENSMB = 0), SMBus Slave Mode (ENSMB = 1) and SMBus Master Mode (ENSMB = float) to load register information from external EEPROM. Refer to [SMBUS Master Mode](#) for more information.

8.2 Functional Block Diagram

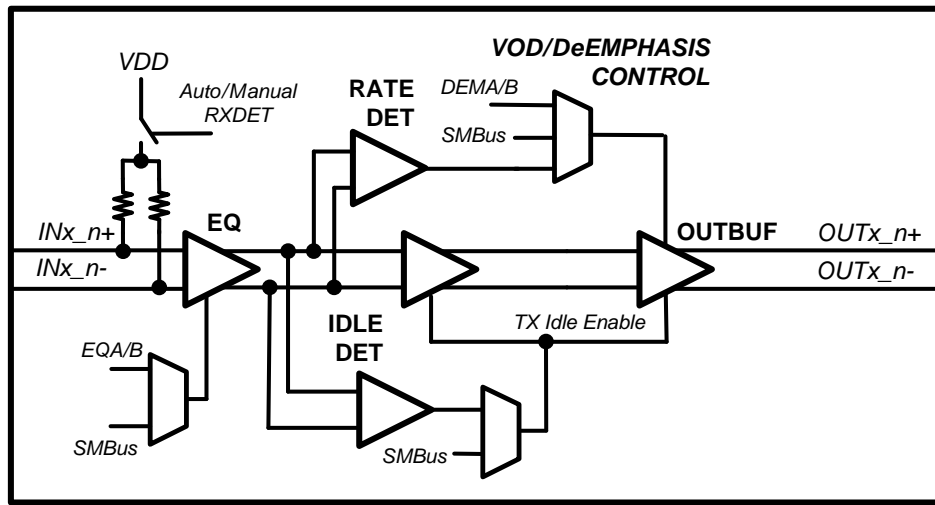

Figure 8. Block Diagram - Detail View of Channel (1 of 8)

8.3 Feature Description

8.3.1 4-Level Input Configuration Guidelines

The 4-level input pins use a resistor divider to help set the 4 valid levels and provide a wider range of control settings when ENSMB=0. There is an internal 30-k Ω pullup and a 60-k Ω pulldown connected to the package pin. These resistors, together with the external resistor connection combine to achieve the desired voltage level. Using the 1-k Ω pullup, 1-k Ω pulldown, no connect, and 20-k Ω pulldown provide the optimal voltage levels for each of the four input states.

Table 1. 4-Level Input Voltage

LEVEL	SETTING	3.3-V MODE	2.5-V MODE
0	Tie 1 k Ω to GND	0.10 V	0.08 V
R	Tie 20 k Ω to GND	$1/3 \times V_{IN}$	$1/3 \times V_{DD}$
Float	Float (leave pin open)	$2/3 \times V_{IN}$	$2/3 \times V_{DD}$
1	Tie 1 k Ω to V_{DD}	$V_{IN} - 0.05 \text{ V}$	$V_{DD} - 0.04 \text{ V}$

- Level 1 - 2 = $0.2 \times V_{IN}$ or V_{DD}
- Level 2 - 3 = $0.5 \times V_{IN}$ or V_{DD}
- Level 3 - 4 = $0.8 \times V_{IN}$ or V_{DD}

To minimize the startup current associated with the integrated 2.5-V regulator the 1-k Ω pullup and pulldown resistors are recommended. If several 4-level inputs require the same setting, it is possible to combine two or more 1-k Ω resistors into a single lower value resistor. For example, combining two inputs with a single 500- Ω resistor is a good way to save board space.

8.3.2 PCIe Signal Integrity

When using the DS125BR800 in PCIe Gen-3 systems, there are specific signal integrity settings to ensure signal integrity margin. The settings were achieved with completing extensive testing. Contact your field representative for more information regarding the testing completed to achieve these settings.

For tuning the in the downstream direction (from CPU to EP).

- EQ: use the guidelines outlined in [Table 2](#).
- De-Emphasis: use the guidelines outlined in [Table 3](#).
- VOD: use the guidelines outlined in [Table 3](#).

For tuning in the upstream direction (from EP to CPU).

- EQ: use the guidelines outlined in [Table 2](#).
- De-Emphasis:
 - For trace lengths < 15" set to -3.5 dB
 - For trace lengths > 15" set to -6 dB
- VOD: set to 900 mV

8.3.2.1 RX-Detect in SAS/SATA (up to 6 Gbps) Applications

Unlike PCIe systems, SAS/SATA (up to 6 Gbps) systems use a low speed Out-Of-Band or OOB communications sequence to detect and communicate between Controllers/Expanders and target drives. This communication eliminates the need to detect for endpoints like PCIe. For SAS/SATA systems, it is recommended to tie the RXDET pin high. This will ensure any OOB sequences sent from the Controller/Expander will reach the target drive without any additional latency due to the termination detection sequence defined by PCIe.

(1) VDD = 2.5 V, 25°C and 0101 pattern at 8 Gbps

8.3.2.1.1 Signal Detect Control for Datarates above 8 Gbps

Signal detect bandwidth limitations combined with high levels of signal attenuation can result in intermittent data loss above 8 Gbps. This data loss can be eliminated by disabling automatic detection and forcing the Signal Detect function to be always "on". This programming requires SMBus control over the DS125BR800 to be present. The Signal Detect function is controlled for each channel independently. The register programming sequence is shown below:

1. Write register 0x06 = 0x18 // * Enable SMBus register programming

2. Write registers 0x0D[1]= 1'b, 0x14[1] = 1'b, 0x1B[1] = 1'b, 0x22[1] = 1'b /* CH0 - CH3
3. Write registers 0x2A[1]= 1'b, 0x31[1] = 1'b, 0x38[1] = 1'b, 0x3F[1] = 1'b /* CH4 - CH7

Table 6. MODE Operation With Pin Control

MODE (PIN 21)	Driver Characteristics	PCIe	SAS SATA	10G-KR	10GbE	CPRI OBSAI	SRIO (R)XAUI	Interlaken Infiniband
0	Limiting		X		X	X	X	X
R	Transparent without DE							
F (default)	Automatic	X						
1	Transparent with DE			X				

NOTE: Automatic operation allows input to "sense" the incoming data-rate and utilize a "Transparent" output driver for operation at or above 8 Gbps.

NOTE: SAS/SATA up to 6 Gbps.

8.3.2.2 MODE Operation with SMBus Registers

When in SMBus mode (Slave or Master), the MODE pin retains control of the output driver characteristics. In order to override this control function, Register 0x08[2] must be written with a "1". Writing this bit enables MODE control of each channel individually using the channel registers defined in [Table 10](#).

8.4 Device Functional Modes

8.4.1 Pin Control Mode

When in pin mode (ENSMB = 0), equalization and de-emphasis can be selected via pin for each side independently. When de-emphasis is asserted VOD is automatically adjusted per [Table 3](#). For PCIe applications, the RXDET pins provides automatic and manual control for input termination (50 Ω or >50 kΩ). MODE setting is also pin controllable with pin selections (PCIe Gen-1, PCIe Gen-2, auto detect, and PCIe Gen-3). The receiver electrical idle detect threshold is also adjustable via the SD_TH pin.

8.4.2 SMBus Mode

When in SMBus mode (ENSMB = 1), the VOD (output amplitude), equalization, de-emphasis, and termination disable features are all programmable on a individual lane basis, instead of grouped by A or B as in the pin mode case. Upon assertion of ENSMB, the EQx and DEMx functions revert to register control immediately. The EQx and DEMx pins are converted to AD0-AD3 SMBus address inputs. The other external control pins (MODE, RXDET and SD_TH) remain active unless their respective registers are written to and the appropriate override bit is set, in which case they are ignored until ENSMB is driven low (pin mode). On power-up and when ENSMB is driven low all registers are reset to their default state. If PWDN is asserted while ENSMB is high, the registers retain their current state.

Equalization settings accessible via the pin controls were chosen to meet the needs of most high speed applications. If additional fine tuning or adjustment is needed, additional equalization settings can be accessed via the SMBus registers. Each input has a total of 256 possible equalization settings. [4-Level Input Configuration Guidelines](#) shows the 16 setting when the device is in pin mode. When using SMBus mode, the equalization, VOD and de-Emphasis levels are set by registers.

8.5 Programming

8.5.1 SMBus Master Mode

The DS125BR800 devices support reading directly from an external EEPROM device by implementing SMBus Master mode. When using the SMBus master mode, the DS125BR800 will read directly from specific location in the external EEPROM. When designing a system for using the external EEPROM, the user needs to follow these specific guidelines. For additional information, refer to [SNLA228](#).

- Set ENSMB = Float — enable the SMBUS master mode.
- The external EEPROM device address byte must be 0xA0 and capable of 520 kHz operation at 2.5 V and 3.3 V supply.

Programming (continued)

- Set the AD[3:0] inputs for SMBus address byte. When the AD[3:0] = 0000'b, the device address byte is 0xB0.

When tying multiple DS125BR800 devices to the SDA and SCL bus, use these guidelines to configure the devices.

- Use SMBus AD[3:0] address bits so that each device can load its configuration from the EEPROM. Example below is for 4 devices.
 - U1: AD[3:0] = 0000 = 0xB0,
 - U2: AD[3:0] = 0001 = 0xB2,
 - U3: AD[3:0] = 0010 = 0xB4,
 - U4: AD[3:0] = 0011 = 0xB6
- Use a pull-up resistor on SDA and SCL; value = 2 kΩ
- Daisy-chain $\overline{\text{READ_EN}}$ (pin 26) and $\overline{\text{ALL_DONE}}$ (pin 27) from one device to the next device in the sequence so that they do not compete for the EEPROM at the same time.
 - Tie $\overline{\text{READ_EN}}$ of the 1st device in the chain (U1) to GND
 - Tie $\overline{\text{ALL_DONE}}$ of U1 to $\overline{\text{READ_EN}}$ of U2
 - Tie $\overline{\text{ALL_DONE}}$ of U2 to $\overline{\text{READ_EN}}$ of U3
 - Tie $\overline{\text{ALL_DONE}}$ of U3 to $\overline{\text{READ_EN}}$ of U4
 - Optional: Tie $\overline{\text{ALL_DONE}}$ output of U4 to a LED to show the devices have been loaded successfully

Below is an example of a 2 kbits (256 x 8-bit) EEPROM in hex format for the DS125BR800 device. The first 3 bytes of the EEPROM always contain a header common and necessary to control initialization of all devices connected to the I2C bus. CRC enable flag to enable/disable CRC checking. If CRC checking is disabled, a fixed pattern (8'hA5) is written/read instead of the CRC byte from the CRC location, to simplify the control. There is a MAP bit to flag the presence of an address map that specifies the configuration data start in the EEPROM. If the MAP bit is not present the configuration data start address is derived from the DS125BR800 address and the configuration data size. A bit to indicate an EEPROM size > 256 bytes is necessary to properly address the EEPROM. There are 37 bytes of data size for each DS125BR800 device. For additional information on EEPROM programming, refer to [SNLA228](#).

NOTE: CRC_EN = 0, Address Map = 1, >256 byte = 0, Device Count[3:0] = 3. This example has all 8 channels set to EQ = 00 (min boost), VOD = 1.0 V, DEM = 0 (0 dB) and multiple device can point to the same address map. Maximum EEPROM size is 8kbits (1024 x 8-bits).

8.5.2 Transfer of Data Via the SMBus

During normal operation the data on SDA must be stable during the time when SCL is High.

There are three unique states for the SMBus:

START: A High-to-Low transition on SDA while SCL is High indicates a message START condition.

STOP: A Low-to-High transition on SDA while SCL is High indicates a message STOP condition.

IDLE: If SCL and SDA are both High for a time exceeding t_{BUF} from the last detected STOP condition or if they are High for a total exceeding the maximum specification for t_{HIGH} then the bus will transfer to the IDLE state.

8.5.3 System Management Bus (SMBus) and Configuration Registers

The System Management Bus interface is compatible to SMBus 2.0 physical layer specification. $ENSMB = 1\text{ k}\Omega$ to VDD to enable SMBus slave mode and allow access to the configuration registers.

The DS125BR800 has the AD[3:0] inputs in SMBus mode. These pins are the user set SMBUS slave address inputs. The AD[3:0] pins have internal pull-down. When left floating or pulled low the AD[3:0] = 0000'b, the device default address byte is 0xB0. Based on the SMBus 2.0 specification, the DS125BR800 has a 7-bit slave address. The LSB is set to 0'b (for a WRITE). The device supports up to 16 address byte, which can be set with the AD[3:0] inputs. [Table 9](#) shows the 16 addresses.

Table 9. Device Slave Address Bytes

AD[3:0] Settings	Address Bytes (HEX)
0000	B0
0001	B2
0010	B4
0011	B6
0100	B8
0101	BA
0110	BC
0111	BE
1000	C0
1001	C2
1010	C4
1011	C6
1100	C8
1101	CA
1110	CC
1111	CE

The SDA, SCL pins are 3.3 V tolerant, but are not 5 V tolerant. External pull-up resistor is required on the SDA. The resistor value can be from 1 k Ω to 5 k Ω depending on the voltage, loading and speed. The SCL may also require an external pull-up resistor and it depends on the Host that drives the bus.

8.5.4 SMBus Transactions

The device supports WRITE and READ transactions. See [Table 10](#) for register address, type (Read/Write, Read Only), default value and function information.

8.5.5 Writing a Register

To write a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a "0" indicating a WRITE.
2. The Device (Slave) drives the ACK bit ("0").
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit ("0").
5. The Host drive the 8-bit data byte.
6. The Device drives an ACK bit ("0").
7. The Host drives a STOP condition.

The WRITE transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

8.5.6 Reading a Register

To read a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a "0" indicating a WRITE.
2. The Device (Slave) drives the ACK bit ("0").
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit ("0").
5. The Host drives a START condition.
6. The Host drives the 7-bit SMBus Address, and a "1" indicating a READ.
7. The Device drives an ACK bit "0".
8. The Device drives the 8-bit data value (register contents).
9. The Host drives a NACK bit "1" indicating end of the READ transfer.
10. The Host drives a STOP condition.

The READ transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DS125BR800 is a high performance circuit capable of delivering excellent performance. Careful attention must be paid to the details associated with high-speed design as well as providing a clean power supply. Refer to [Layout Guidelines](#) and the *LVDS Owner's Manual, SNLA187*, for more detailed information on high speed design tips to address signal integrity design issues.

9.2 Typical Application

Figure 9. Typical Application

9.2.1 Design Requirements

As with any high speed design, there are many factors which influence the overall performance. Below are a list of critical areas for consideration and study during design.

- Use 100 Ω impedance traces. Generally these are very loosely coupled to ease routing length differences.
- Place AC-coupling capacitors near to the receiver end of each channel segment to minimize reflections.
- The maximum body size for AC-coupling capacitors is 0402.
- Back-drill connector vias and signal vias to minimize stub length.
- Use Reference plane vias to ensure a low inductance path for the return current.

9.2.2 Detailed Design Procedure

The DS125BR800 is designed to be placed at a location where the input CTLE can help to compensate for a portion of the overall channel attenuation. In order to optimize performance, the repeater requires tuning to extend the reach of the cable or trace length while also recovering a solid eye opening. To tune the repeater, the settings mentioned in [Table 2](#) and [Table 3](#) (for Pin Mode) are recommended as a default starting point for most applications. Once these settings are configured, additional tuning of the EQ and, to a lesser extent, VOD may be required to optimize the repeater performance for each specific application environment. Examples of the repeater performance as a generic high speed datapath repeater are illustrated in the performance curves in the next section.

10 Power Supply Recommendations

10.1 3.3-V or 2.5-V Supply Mode Operation

The DS125BR800 has an optional internal voltage regulator to provide the 2.5-V supply to the device. In 3.3-V mode operation, the VIN pin = 3.3 V is used to supply power to the device. The internal regulator will provide the 2.5 V to the VDD pins of the device and a 0.1- μ F cap is needed at each of the 5 VDD pins for power supply decoupling (total capacitance should be $\leq 0.5 \mu$ F), and the VDD_SEL pin must be tied to GND to enable the internal regulator. In 2.5-V mode operation, the VIN pin should be left open and 2.5-V supply must be applied to the 5 VDD pins to power the device. The VDD_SEL pin must be left open (no connect) to disable the internal regulator.

10.2 Power Supply Bypassing

Two approaches are recommended to ensure that the DS125BR800 is provided with an adequate power supply. First, the supply (VDD) and ground (GND) pins should be connected to power planes routed on adjacent layers of the printed circuit board. The layer thickness of the dielectric should be minimized so that the VDD and GND planes create a low inductance supply with distributed capacitance. Second, careful attention to supply bypassing through the proper use of bypass capacitors is required. A 0.1- μ F bypass capacitor should be connected to each VDD pin such that the capacitor is placed as close as possible to the DS125BR800. Smaller body size capacitors can help facilitate proper component placement. Additionally, capacitor with capacitance in the range of 1 μ F to 10 μ F should be incorporated in the power supply bypassing design as well. These capacitors can be either tantalum or an ultra-low ESR ceramic.

11 Layout

11.1 Layout Guidelines

The CML inputs and LPDS outputs have been optimized to work with interconnects using a controlled differential impedance of 85 - 100 Ω . It is preferable to route differential lines exclusively on one layer of the board, particularly for the input traces. The use of vias should be avoided if possible. If vias must be used, they should be used sparingly and must be placed symmetrically for each side of a given differential pair. Whenever differential vias are used the layout must also provide for a low inductance path for the return currents as well. Route the differential signals away from other signals and noise sources on the printed circuit board. See AN-1187 for additional information on LLP packages.

[Figure 27](#) depicts different transmission line topologies which can be used in various combinations to achieve the optimal system performance. Impedance discontinuities at the differential via can be minimized or eliminated by increasing the swell around each hole and providing for a low inductance return current path. When the via structure is associated with thick backplane PCB, further optimization such as back drilling is often used to reduce the detrimental high frequency effects of stubs on the signal path.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
