SKY12343-364LF: 0.01 to 4.0 GHz Seven-Bit Digital Attenuator with Serial and Parallel Drivers

Applications

- Cellular and 3G infrastructure
- WiMAX, LTE, 4G infrastructure

Features

- Broadband operation: 0.01 to 4.0 GHz
- Attenuation range: 31.75 dB with 0.25 dB LSB
- TTL/CMOS-compatible serial, parallel, or latched parallel control interface
- Single supply voltage: +3.3 or +5 V
- Small QFN (32-pin, 5 x 5 mm) Pb-free package (MSL1, 260 °C per JEDEC J-STD-020)

Skyworks Green™ products are compliant with all applicable legislation and are halogen-free. For additional information, refer to *Skyworks Definition of Green™*, document number SQ04–0074.

Figure 1. SKY12343-364LF Block Diagram

Description

The SKY12343-364LF is a GaAs broadband seven-bit pHEMT digital attenuator with a 0.25 dB least significant bit (LSB). The programming logic levels are TTL/CMOS-compatible with both a dual mode serial controller and an integrated Serial Peripheral Interface (SPI) controller.

The SKY12343-364LF attenuator features low insertion loss, excellent attenuation accuracy, a 31.75 dB attenuation range, and high-linearity performance. The device is an ideal choice for a wide variety of 3G and 4G cellular infrastructure applications.

A functional block diagram is shown in Figure 1. The pin configuration and package are shown in Figure 2. Signal pin assignments and functional pin descriptions are provided in Table 1.

Table 1. SKY12343-364LF Signal Descriptions

Pin	Name	Description	Pin	Name	Description
1	N/C	No connection[1]	17	N/C	No connection[1]
2	VDD	DC power supply	18	RF2	RF input/output to digital attenuator
3	P/S	Serial or parallel operation select. Logic low enables parallel mode.	19	N/C	No connection[1]
4	A0	Address bit A0	20	N/C	No connection[1]
5	N/C	No connection[1]	21	A2	Address bit A2
6	N/C	No connection (Note 1)	22	A1	Address bit A1
7	RF1	RF input/output to digital attenuator	23	LATCH_ENABLE	On rising edge of pulse, shifts the most recent clocked-in data and address bits to set the attenuation state. In parallel mode, if this signal is logic high, changes to the V1 through V7 signals occur directly. If this signal is logic low, the attenuator does not change states until this signal is raised.
8	N/C	No connection[1]	24	CLOCK	Clock input
9	N/C	No connection[1]	25	DATA_IN	Serial data input
10	N/C	No connection[1]	26	V1	Parallel attenuation control input
11	N/C	No connection[1]	27	V2	Parallel attenuation control input
12	N/C	No connection[1]	28	V3	Parallel attenuation control input
13	N/C	No connection[1]	29	V4	Parallel attenuation control input
14	N/C	No connection[1]	30	V5	Parallel attenuation control input
15	N/C	No connection[1]	31	V6	Parallel attenuation control input
16	N/C	No connection[1]	32	V7	Parallel attenuation control input

[1] May be connected to ground with no change in performance.

Functional Description

The SKY12343-364LF is a seven-bit digital attenuator comprised of a GaAs attenuator and a silicon CMOS driver. The attenuation setting is controlled by a serial or parallel interface.

Pin 3 (P/S) selects the input mode of the attenuator. A logic low signal applied to pin 3 enables parallel mode; a logic high enables serial mode. Control logic levels are defined in Table 2.

Serial Data Programming

Parallel Mode Interface

In parallel mode, the desired attenuation state is selected using the seven CMOS-compatible control lines, V1 through V7 (pins 26 through 32). The logic for these pins is presented in Table 3. A logic level low on these pins places the device in the minimum insertion loss state while a logic high places the part in the maximum 31.75 dB insertion loss state. Intermediate levels of attenuation are the total attenuation represented by the major bits selected with logic high.

When the LATCH_ENABLE signal (pin 23) is held high, direct parallel programming through pins 26 through 32 is possible, which is useful for manual control of the device attenuation states.

For latched parallel programming, the LATCH_ENABLE signal should be held low while the inputs to pins 26 through 32 are applied for the desired attenuation state. When the LATCH_ENABLE signal is pulsed high to low, the desired attenuation state is latched.

Serial Mode Interface

In serial mode, the SKY12343-364LF is programmed using an 8-bit attenuation word and an 8-bit address word as shown in Figure 3. The attenuation word controls the attenuation state of the device as shown in Table 4. As with parallel mode programming, intermediate levels of attenuation are the total attenuation represented by the major bits selected with logic high.

For systems that use multiple SKY12343-364LF devices on a single programming bus, up to eight devices can be individually addressed using the address word and the device address signals A0, A1, and A2 (pins 4, 22, and 21, respectively). A device responds to a change in an attenuation setting when its address matches the address defined by the address word. The address word logic is shown in Table 5.

Note that the logic levels of bits A3 to A7 of the address word are "don't care" bits as shown in Figure 3.

Serial input data (DATA_IN pin) is shifted into the register on the rising edge of the CLOCK signal (pin 24), Least Significant Bit (LSB) first. The attenuator changes states on the rising edge of the LATCH_ENABLE signal (pin 23) according to the most recent seven bits of shifted data accepted since the previous falling edge of the LATCH_ENABLE signal. The shift register must be loaded with LATCH_ENABLE held at logic low to prevent the attenuator from changing attenuation states as data is entered. Once the attenuation data is loaded, the LATCH_ENABLE input should be toggled high and then low to set the new attenuation state.

Refer to the timing diagram in Figure 4 and timing parameters in Table 6.

Power Up and Initialization

Power Up. Voltage in the allowable range from 3.3 to 5.0 V is applied to the VDD signal (pin 2). At power up, LATCH_ENABLE should be logic low. Immediately after power up, wait approximately 400 μs before setting LATCH_ENABLE logic high to allow for internal device voltages to settle. During this period, the device defaults to the maximum insertion loss state of 31.75 dB.

Direct Parallel Mode (P/S pin set to logic low and LATCH_ENABLE pin set to logic high). The SKY12343_364LF should always be powered up with the LATCH_ENABLE signal at logic low. Therefore, powering up in direct parallel mode is not recommended.

The device attenuation state can be preset to any value with the appropriate logic levels on pins 26 to 32 before power up. Immediately after power up and the associated 400 μs delay, LATCH_ENABLE can be toggled to logic high. The device attenuation state changes to the attenuation level that corresponds to the logic levels on pins 26 to 32. If these attenuation logic levels are allowed to float, the device powers up in the minimum insertion loss state when LATCH_ENABLE is set to logic high.

Latched Parallel Mode (P/S pin and LATCH_ENABLE pin set to logic low). The device attenuation state can be preset to any value with the appropriate logic levels on pins 26 to 32 before power up. Immediately after power up and the associated 400 μs delay, the device attenuation changes to the attenuation level that corresponds to the logic levels on pins 26 to 32 on the rising edge of the first LATCH_ENABLE signal.

As noted above, the device attenuation state defaults to the minimum insertion loss if pins 26 to 32 are allowed to float. In latched parallel mode, the attenuation setting on pins 26 to 32 can be latched into the internal register at the falling edge of the LATCH_ENABLE signal.

Serial Addressable Mode (P/S pin set to logic high and LATCH_ENABLE pin set to logic low). For power up in this mode, the parallel control input pins 26 to 32 must be set to logic low. The device powers up in the maximum insertion loss state and remains in that condition until the next programming word is latched after the initial 400 μs delay.

Electrical and Mechanical Specifications

The absolute maximum ratings of the SKY12343-364LF are provided in Table 7. Electrical specifications are provided in Table 8.

Typical performance characteristics of the SKY12343-364LF are illustrated in Figures 5 through 18.

[1] Exposure to maximum rating conditions for extended periods may reduce device reliability. There is no damage to device with only one parameter set at the limit and all other parameters set at or below their nominal value. Exceeding any of the limits listed here may result in permanent damage to the device.

ESD HANDLING: *Although this device is designed to be as robust as possible, electrostatic discharge (ESD) can damage this device. This device must be protected at all times from ESD when handling or transporting. Static charges may easily produce potentials of several kilovolts on the human body or equipment, which can discharge without detection. Industry-standard ESD handling precautions should be used at all times.*

Evaluation Board Description

The SKY12343-364LF Evaluation Board is used to test the performance of the SKY12343-364LF digital attenuator. An assembly drawing for the Evaluation Board is shown in Figure 19 and an Evaluation Board schematic diagram is shown in Figure 20. Table 9 provides the Evaluation Board Bill of Materials (BOM) list.

Package Dimensions

The PCB layout footprint for the SKY12343-364LF is shown in Figure 21. Typical part markings are noted in Figure 22. Package dimensions are shown in Figure 23, and tape and reel dimensions are provided in Figure 24.

Package and Handling Information

Instructions on the shipping container label regarding exposure to moisture after the container seal is broken must be followed. Otherwise, problems related to moisture absorption may occur when the part is subjected to high temperature during solder assembly.

The SKY12343-364LF is rated to Moisture Sensitivity Level 1 (MSL1) at 260 °C. It can be used for lead or lead-free soldering. For additional information, refer to the Skyworks Application Note, *Solder Reflow Information*, document number 200164.

Care must be taken when attaching this product, whether it is done manually or in a production solder reflow environment. Production quantities of this product are shipped in a standard tape and reel format.
